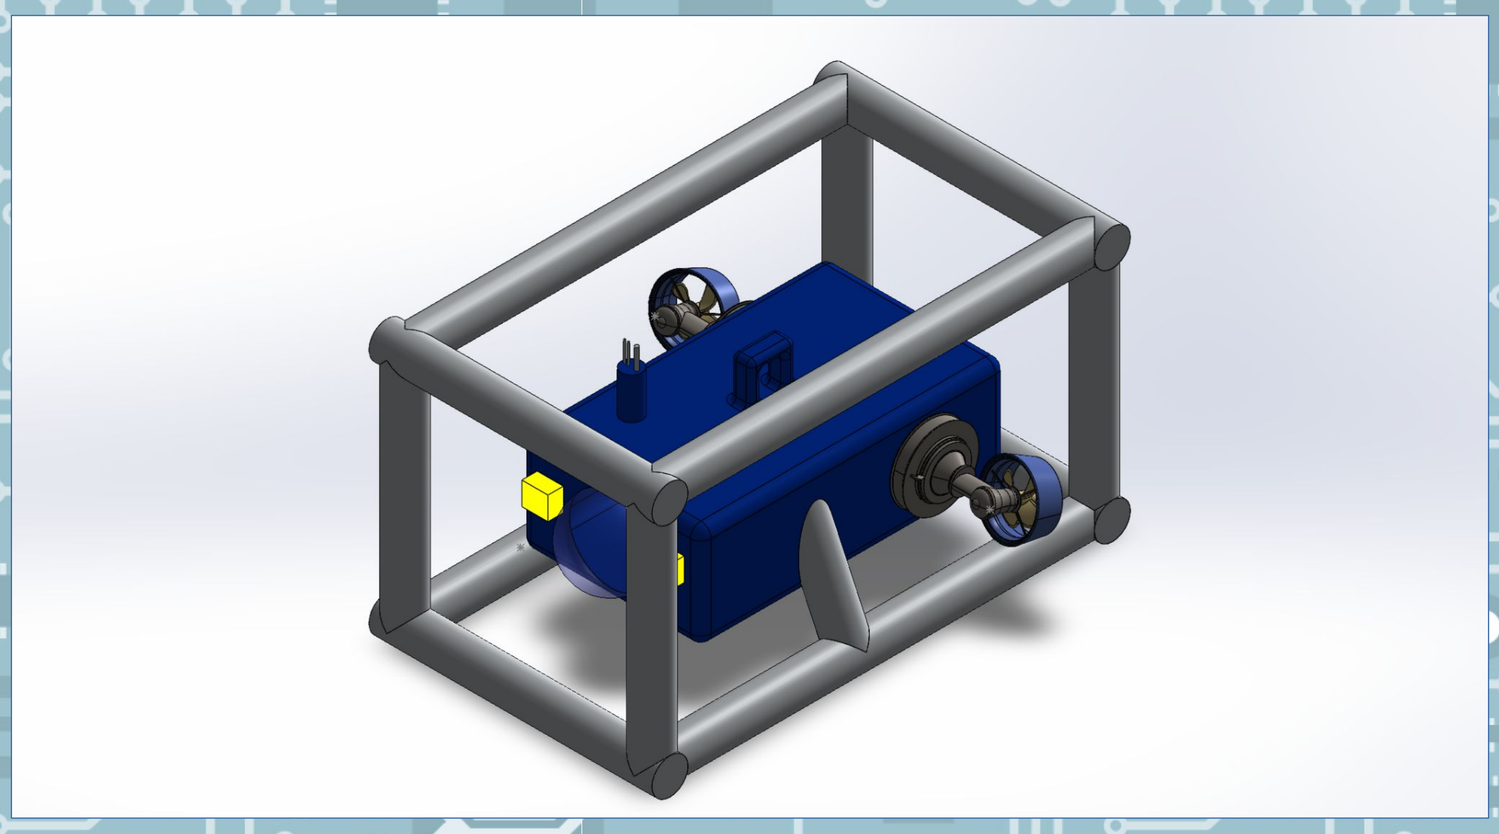
Rugged Submersible Surveyor

Embedded Systems Design Project II
EGR314 Spring 2026

Jacob D, Sam B, Adrian P, Andrew I, Sam M, and Mo A



Our submarine functions by integrating modules into one design: an HMI with integrated joysticks, an oled screen, a central esp32 processing hub, a motor driver, and inertia, temperature and photoelectric sensors. Together, these components form a cohesive and functional platform for our EGR 314 project.

The project also requires our submarine to function as a fully integrated system using real-time data handling, coordinated hardware–software interaction, reliable power distribution, and a mechanical structure that supports movement, sensing, and remote operation. These expectations ensure the design works as a unified platform rather than separate modules.
